

Transporter™

Transporter™

ACH Direct's Transporter is the perfect tool to automate your electronic payments transaction processing. With its extensive feature set and intuitive design, overall development time is significantly reduced, while creating a professional, seamless solution. Transporter can be used as part of an in-house solution or licensed as part of a commercial application.

Automate Your Financial Transaction Communications

- Credit/debit card and ACH (electronic check) support
- Automatic encryption/decryption and transmission
- Auto re-transmit of failed attempts
- Event notification through e-mail, fax or pager
- Complete logging and reporting of all data transfers
- External application event triggering

How It Works

During set-up, the user designates a directory into which transactional data files will be saved. Transporter will detect that the file has been placed in the designated directory, encrypt the file, and then send the file to ACH Direct for settlement. Additionally, Transporter can be setup to automatically download and decrypt response files and then store the data to the location of your choosing.

With Transporter's external application triggering features, other programs can run automatically when a particular event occurs. Transporter could be used to run an import and process program each time a file is received, or trigger a program that updates an external database when an item is successfully transmitted. The possibilities are virtually unlimited.
